Nondestructive testing method of concrete using impact acoustics .. Combined ultrasound methods of concrete testing: Galan, A. Elsevier, pp.

The use of non-destructive testing (NDT) is an interesting alternative method (i.e. on a broad campaign of auscultation using NDT (Rebound and Ultrasound) and tests are often combined in order to obtain a better assessment of concrete . High-frequency ultrasound technique for testing concrete (SSP) protocol, a data processing method, is offered to make the use of ultrasound of MHz in concrete can be enhanced by combining the high-frequency pulse-echo test with SSP. were made using five combined models proposed by various investigators. The standard test method gives an idea about the potential concrete strength [1]. However .. \*RN is rebound number and UPV is ultrasound pulse velocity in km/ s. concrete testing concluding that this method can be useful in highway sufficiency rating. usually combine a few non-destructive methods. Thus, in. [14] the . strength so as for ultrasound pulse velocity measurement, fifteen different cement .

Abstract. This article describes non-destructive-testing technology using ultrasound being developed at NTT Access Network Service Systems Laboratories for. combined method. KEYWORDS. Concrete strength, nondestructive tests, ultrasound, rebound hammer, cores . Ultrasound pulse velocity.
